ID	Type	Description	Priority
FR-001	Functional	The system shall enable student teams to create their own profiles containing abstract summaries, demo video links, and verified GitHub repository URLs.	**High**
FR-002	Functional	The system shall allow panel judges to view submitted projects and assign grades using digital evaluation rubrics.	**High**
FR-003	Functional	The system shall allow the public to vote for eligible student projects during the project expo.	**High**
FR-004	Functional	The system shall calculate and display project leaderboards based on judge grades and public voting results.	**High**
FR-005	Functional	The system shall prevent a public voter from submitting multiple votes for the same project during the voting period.	**Medium**
NFR-001	Performance & Security	The public voting and leaderboard calculations shall update in real-time with an API response latency under 300 ms.	**Medium**
NFR-002	Security	The system shall enforce anti-sybil protections to prevent unauthorized(People or systems that are not a part of the event) or duplicate voting identities from manipulating public voting results.	**High**

Acceptance Criteria	Rationale
When the student team enters an abstract, demo video link, and **VALID** GitHub repository URL the system will accept the input. The system saves the details and displays the new project profile.	Core functionality for showcasing projects.
When a panel judge opens a submitted project, selects scores for the rubric criteria, and selects **“Submit Evaluation,”** the system saves the grades and shows an evaluation confirmation.	Enables digital project evaluation.
When a public voter selects an eligible project and clicks **“Vote,”** the system records the vote and displays a confirmation message.	Enables public participation.
When the system receives updated judge grades or public votes, the leaderboard recalculates the project rankings and displays the updated order.	Provides project rankings.
When a voter who has already voted for a project selects **“Vote”** for the same project again, the system rejects the second vote and keeps the project's vote count unchanged.	Supports fair voting.
When a user submits a vote or requests the leaderboard, the system displays the result within **300 milliseconds**.	Ensures responsive voting and rankings.
When the system identifies a duplicate or suspicious voting attempt, it rejects the attempt and does not add the vote to the project's total.	Maintains integrity of public voting.

Use Case: Create Showcase Profile

Primary Actor: Student Team

Goal: The student team creates and publishes a project showcase profile containing the required project information.

Preconditions

1. The student team has access to the showcase system.
2. The student team has project information ready.
3. The student has an abstract summary, demo video link, and GitHub repository URL.

Postconditions

1. The project showcase profile is created successfully.
2. The submitted project information is stored in the system.
3. The verified GitHub repository URL is associated with the profile.

Main Success Scenario

1. Student team opens the project showcase system.
2. Student selects **Create Showcase Profile**.
3. System displays the project profile form.
4. Student enters the project abstract summary.
5. Student enters the demo video link.
6. Student enters the GitHub repository URL.
7. System validates the GitHub repository URL.
8. System confirms that the submitted information is valid.
9. Student submits the showcase profile.
10. System creates and publishes the project showcase profile.
11. System displays a confirmation that the profile has been created successfully.

Alternate Flow — Invalid GitHub URL

7a. System determines that the GitHub repository URL is invalid or cannot be verified.

7a1. System displays an error message.

7a2. Student provides a corrected GitHub repository URL.

7a3. System validates the new URL.

7a4. If valid, the flow continues from Step 8.
